

Hilton New Orleans Riverside

Oct 7, 6:15 a.m. CDT / 7:15 a.m. EDT

Tropical Storm Isaias

Prepare for Friday. The main threat has shifted east.

TL;DR

Timing	Finish readiness checks Thursday. StormGeo’s New Orleans 25+ mph sustained-wind window begins Friday at 12:55 p.m. CDT.
Local weather	NWS shows Friday gusts to 40 mph and possible tropical-storm conditions Friday night; StormGeo’s named point peaks at 46 mph gusts.
Decision	Confirm critical services, guest communications and staffing now. A westward track change would increase local concern.

Friday	Main planning day Oct 9 · afternoon into night
40 / 46 mph	Two local gust forecasts NWS vicinity / StormGeo named point
2–5 in	StormGeo rain scenario Cyclone passage; accumulation period unspecified

What changed since October 6

- Wind window advances to Friday afternoon.
- Point peak gust decreases: 53 → 46 mph.
- Eastward track reduces current direct exposure; uncertainty remains.

Intensity tail

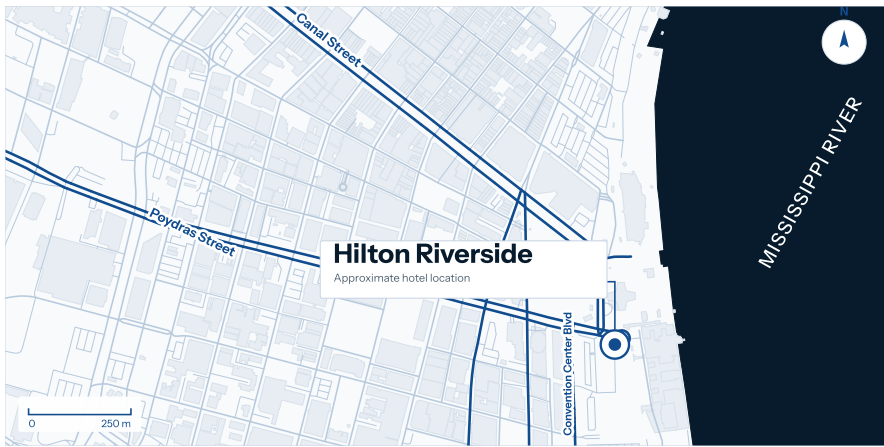

Sustained ≥74 mph: StormGeo 9%; NHC city 1%. Different points/windows; neither measures hotel damage.

Planning timeline

Now · Wed Oct 7	Thu Oct 8
Confirm the plan Verify decision owners, critical systems and guest needs.	Complete readiness Recommended target: finish checks, staffing and response coordination.
Fri Oct 9	Sat Oct 10
Monitor local effects Monitor wind and rain; retain NWS Friday-night contingency.	Check before resuming Verify systems and access against actual conditions and official direction.

Next update: Refresh after StormGeo’s 9 a.m. CDT full advisory or any earlier official watch or material track change.

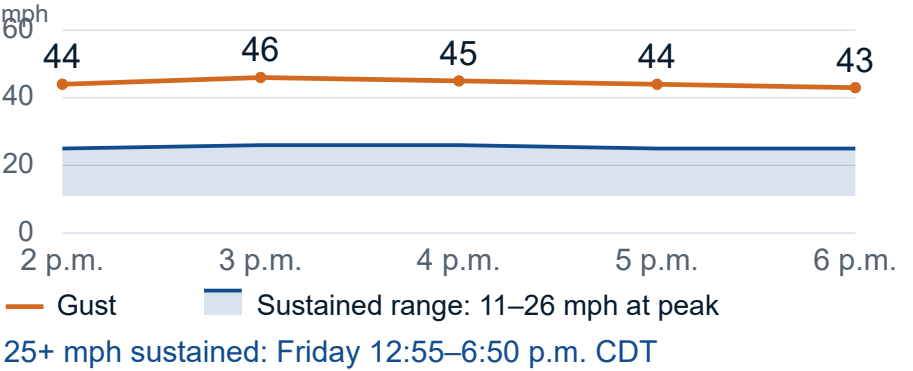

Where the exposure sits

Hilton location · OpenStreetMap · NOLA Ready

Friday gusts peak at 46 mph

StormGeo Advisory 4 · valid Oct 7, 3 a.m. CDT · named New Orleans point, not a verified hotel forecast.

Official and private forecasts

QUESTION	NOAA / NHC / NWS	STORMGEO	OPERATIONAL MEANING
Friday gusts	NWS vicinity: 40 mph	StormGeo point: 46 mph	Both support securing outdoor items and checking power continuity.
Sustained wind ≥39 mph	NHC city: 11% / five days	StormGeo: 28% / passage	Different points and windows. Retain a higher-wind contingency.
Rainfall exposure	WPC: Marginal coastal LA risk	StormGeo: 2–5 in rainfall	Street ponding may disrupt access without hotel inundation.

Plan for three outcomes

Current eastward track

Strongest effects remain farther east; local rain and gusts still occur.

Response: Maintain readiness and monitor each advisory.

Westward shift

Closer core or heavier bands raise local wind, water-entry and access concerns.

Response: Reassess guest services and critical-system contingency thresholds.

Worst credible disruption

Power loss, rain intrusion and street-access disruption occur together.

Response: Use verified backup capability and client plans; no duration or flood depth is forecast.

Decisions to make now

Engineering	Verify tested critical systems, fuel, cooling, water and drainage.
Hotel operations	Confirm staffing, guest messaging, mobility needs and decision authority.
Security / logistics	Verify guest, delivery and transport access against current street conditions.
Risk / NorthStar	Review SOPs, escalation contacts and response priorities before Friday.

NorthStar can support readiness and recovery. Pre-loss planning · Water mitigation · Structural drying · Facility support

Read the limits

- StormGeo points are not verified properties. Wind ranges are maximum likely hourly observations; gusts differ from sustained wind.
- Probabilities use different points/windows: StormGeo passage; NHC five-day one-minute sustained wind. No averaging.
- Private rain totals lack an explicit period; coastal-water values lack a datum. No hotel flood depth is established.
- PLAC: assessed June 2019; cover updated April 2024. Current systems and capacities require confirmation. Dated briefing; no automatic updates.
